Fast File Server Synchronization with Office 365

LAYER2 CLOUD CONNECTOR

Office 365

100+
apps and systems

> *Brilliant tool, e.g. for replicating local files to a Sharepoint Online library. The assistance I received from Layer2 was outstanding.*
>
> **Melanie Cook, Data Fast Systems Pty. Ltd.**

FEATURES & BENEFITS

The Layer2 Cloud Connector closes gaps and solves issues that still exists with local file server migration, integration, & backup in Microsoft Office 365, SharePoint, OneDrive, Teams, Groups, and Azure using the Microsoft sync client:

- The connector offers a general approach for on-premises-to-cloud but also cloud-to-cloud synchronizations that includes file server data such as department shares and user home drives.

- Several data sources supported: files on local discs and file server shares such as OneDrive, Google Drive, DropBox, and Box via synced local copies.

- SharePoint to SharePoint connections supported: across site-collections or across tenants as well as SharePoint on-premises to Online.
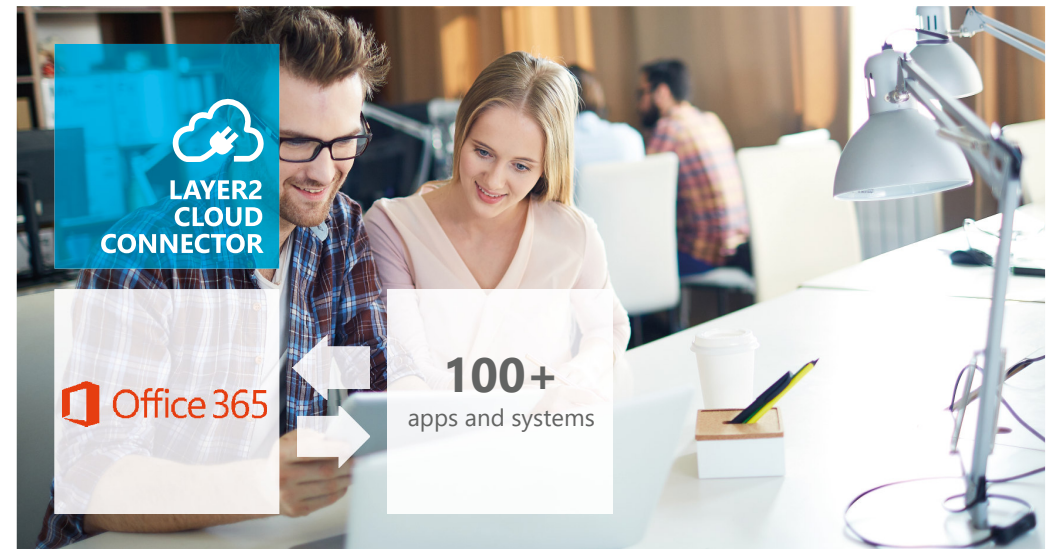

- No limitations regarding the number of files to sync: the SharePoint list view threshold issue (>5.000 / 20.000 files) does not apply to sync.

- SQL-like query language is supported on the file server side to sync specific pre-selected files only.

- SharePoint views are supported to aggregate multiple file sources into the same SharePoint library.

- One-way sync (migration or backup) and two-way sync (permanent hybrid integration) are supported.

- Flexible field/column mapping is available to add metadata.

- Dynamic columns are available to add custom business logic in C#.

- Secure connection: the connector runs as a Windows service, on a server or client, inside the corporate network with Internet connectivity. It is possibily to run the connector in the cloud (VM) as well. No data is exposed to any 3rd party. Direct connections via SSL/HTTPS.

- File synchronization is just one option: 100+ more data sources are supported for codeless sync, such as databases, ERP/CRM, and more.
