

Location Based Alerting for Enterprise

Trust you'll receive critical alerts right away

Key Use Cases

See Something,
Say Something

Active Shooter

Travel Security

Lone Worker
Safety

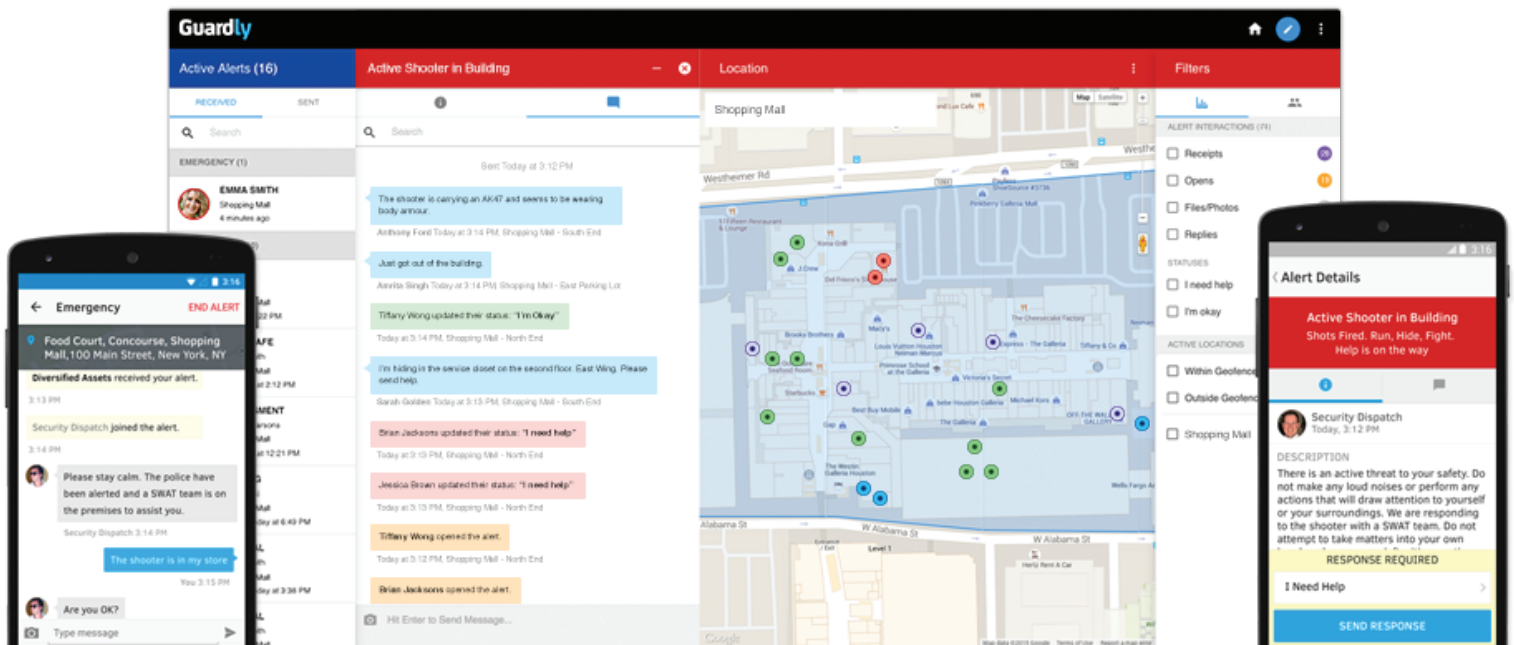

Workplace
Violence

Guardly administrators within your organization have the ability to [send mobile alerts](#) to you based on your location or user-group, which helps ensure you only get messages relevant to you at the time.

- Easily view alert attachments
- Respond to alerts with your status
- Reply securely with text, a photo or video
- All interactions are IPS-tagged/GPS-tagged

Save time locating people inside large buildings

GPS doesn't work effectively indoors. Guardly's patented **indoor positioning technology** solves this problem.

Guardly Command is used by security and operations professionals to manage inbound and outbound alerts, communicate, and locate people indoors and around the world. Key new upgrades include:

- Custom alert types can be easily setup such as a Suspicious Activity report, Walk Safe request, or Property Damage alert empowering employees and tenants who see something to say something
- Voice Alerts will call users in a selected user group and deliver text-to-voice messages – with a strong audit trail of call interactions and Alert delivery
- Guardly Command API integrates with other systems to provide location based authentication to traditional alerts and tickets.

With **Guardly IPS**, you get detailed indoor location details of people using Guardly Mobile to launch or interact with an alert.

Ideal for security and operations management of commercial towers, malls, airports, garages, healthcare and many other corporate and public facilities.

Use it with Guardly or contact us to discuss licensing our Indoor Positioning System SDK and IPS enable your own applications today.
