

PRESS RELEASE

When Patients Hate Their Braces

SACRAMENTO, CA—March 23, 2015—After starting orthodontics, it is not unusual for patients to look with dread at the calendar, realizing there are months ahead before their procedure is finished. They often wish their braces were off, and even some clients using Invisalign can tire of wearing aligners, even with weeks left in their treatment plans. The Sacramento Dentistry Group has a solution for patients who want their orthodontics off as fast as possible and the technique is called Propel.

Propel Speeds Up Orthodontics

“I don't like any type of surgeries. I don't want to go under the knife. So for me the best option was Propel.” — Vivian Gonzalez, Propel patient

Many of our Sacramento orthodontics patients are choosing the Propel procedure to accelerate their treatment. For most patients, this technique cuts their treatment time in half, so a one-year plan takes six months and an eighteen-month plan is over in less than a year. While Propel adds little in cost to the overall treatment program, it saves considerably in time. Plus, Propel can be used after you started treatment. So if you originally decided not to use Propel, or if your first dentist did not offer the treatment, the Sacramento Dentistry Group can still accelerate your treatment plan by using the technique.

How Propel Works

“Propel came out on top based on patient experience, cost, predictability and speed.” —*Orthotown* web magazine

Propel is thoroughly tested by scientific studies and university dentists. Dr. Brian Steele and the staff and patients of the Sacramento Dentistry Group are thoroughly pleased with the results produced using Propel. The procedure is simple, relatively pain free and may require only one office visit. To use the technique, our dentists simply create a series of microperforations in the gum that reach down to the underlying bone. By drilling these tiny holes into the jawbone between the teeth, the body is stimulated to release natural chemicals that foster jaw remodeling. Since the purpose of orthodontics is to move your teeth into a different, healthier position, the stimulation provided to the bone by Propel gets the teeth moving faster. In the end, clients wear their orthodontics for less time and may even tackle more difficult procedures with relative ease.

Start Propel Months After Initial Treatment

An orthodontic patient can use Propel at the beginning of a procedure or months after treatment started. Almost all orthodontic patients qualify for Propel and those who try it spend less time wearing their braces or using aligners. If that proposition sounds good to clients using or considering orthodontics, the Sacramento Dentistry Group is here to help. For more information about Propel, prospective patients may write through the website at sacramentodentistry.com, call at 916-538-6900 or stop by the convenient downtown Sacramento office at 1105 E Street.
