September 13, 2020

The Telemetry team is excited to announce a timely and relevant data set addition: "Number Five".

Many classes of malware rely on newly registered domain names to serve as command and control servers. This is particularly relevant in the case of Domain Generation Algorithm (DGA) based malware. Using the new Telemetry data feed "Number Five" we are able to track newly created domains and characterize the networks behind these domains. "Number Five" provides a powerful tool for protecting your networks against emerging threats, with a specific focus on Ransomware.

The founder of Telemetry, Wayne Wheelles, envisioned "Five" as a way to eliminate a threat when it is in it's booster phase, as opposed to re-entry. The company is offering concise five minute demonstrations, called "five for Five".

Please contact phillips@telemetry.ai to schedule a demo or arrange for temporary use of our API to access the data set.
